Abstract: Interest in specific extracorporeal immunoadsorption as an alternative treatment to plasma exchange has prompted the development of devices capable of modifying plasma in patients with cancer or patients undergoing allogeneic bone marrow transplantation. This paper discusses such developments, as well as application studies using immunoadsorption columns with crystalline silica as the solid support.

Main heading: BIOMEDICAL ENGINEERING

Controlled terms: BIOLOGICAL MATERIALS - Bone - CARCINOGENS

Uncontrolled terms: BONE MARROW TRANSPLANTATION - CANCER - EXTRACORPOREAL IMMUNOADSORPTION - MODIFICATION OF PLASMA - PLASMA EXCHANGE
